scattering is the collision of two objects that results in a change of trajectory and energy for example in particle physics such as electrons photons or neutrons are scattered off of a target specimen resulting in a different energy and direction in the field of electromagnetism scattering is the random diffusion of electromagnetic radiation from air masses is an aid in the long range sending of radio signals over geographic obstacles such as mountains this type of scattering applied to the field of acoustics is the spreading of sound in many directions due to irregularities in the transmission medium volume i of scattering will be devoted to basic theoretical ideas approximation methods numerical techniques and mathematical modeling volume ii will be concerned with basic experimental techniques technological practices and comparisons with relevant theoretical work including seismology medical applications meteorological phenomena and astronomy this reference will be used by researchers and graduate students in physics applied physics biophysics chemical physics

medical physics acoustics geosciences optics mathematics and engineering this is the first encyclopedic range work on the topic of scattering theory in quantum mechanics elastodynamics acoustics and electromagnetics it serves as a comprehensive interdisciplinary presentation of scattering and inverse scattering theory and applications in a wide range of scientific fields with an emphasis and details up to date developments scattering also places an emphasis on the problems that are still in active current research the first interdisciplinary reference source on scattering to gather all world expertise in this technique covers the major aspects of scattering in a common language helping to widening the knowledge of researchers across disciplinesthe list of editors associate editors and contributors reads like an international who s who in the interdisciplinary field of scattering
